

POPULATION GROUP-WISE DEPOSIT ANALYSIS

Author: Adeena Salam

Project Overview

This project focuses on analyzing deposit patterns across different population groups using banking deposit data. The analysis was performed using Power BI after preprocessing the raw dataset in Microsoft Excel. The project aims to identify deposit distribution patterns, major contributing population groups, and key insights that support business decision-making.

Objectives

Analyze deposit distribution across population groups, identify major contributors, examine trends and patterns, and develop interactive dashboards for reporting and business intelligence.

Dataset Information

Dataset Used: population-wise-deposits.csv. The dataset contains deposit-related information categorized by different population groups, enabling comparative and trend analysis.

Tools and Technologies Used

Microsoft Excel was used for data cleaning and preprocessing. Power BI was used for data modeling, measure creation, dashboard development, visualization, and reporting.

Data Preprocessing

Preprocessing activities included handling missing values, removing duplicate records, standardizing formats, correcting inconsistencies, validating data quality, and preparing the dataset for analysis.

Data Modeling and Transformation

The cleaned dataset was imported into Power BI where data types were validated, measures were created, and the data model was optimized for reporting and analysis.

Dashboard Development

Interactive dashboards were created to visualize deposit distribution, compare population groups, display KPIs, and provide drill-down and filtering capabilities.

Analysis Performed

The project included deposit distribution analysis, comparative analysis of population groups, contribution analysis, and trend identification.

Key Insights

Deposit contributions vary among population groups. Certain groups contribute significantly more to total deposits, highlighting important customer segments and business opportunities.

Project Workflow

Data Collection → Excel Preprocessing → Data Validation → Power BI Import → Data Modeling → Dashboard Development → Analysis → Reporting.

Files Included

Population Group-Wise Deposit Analysis.pbix, population-wise-deposits.csv, and Project Documentation.pdf.

Conclusion

The project demonstrates how Excel and Power BI can transform raw banking data into actionable insights. Through preprocessing, visualization, and analytical reporting, the project supports data-driven decision-making and business intelligence initiatives.
